# A PRODUCT FORMULA FOR MINIMAL POLYNOMIALS AND DEGREE BOUNDS FOR INVERSES OF POLYNOMIAL AUTOMORPHISMS

JIE-TAI YU

(Communicated by Wolmer V. Vasconcelos)

**ABSTRACT.** By means of Galois theory, we give a product formula for the minimal polynomial  $G$  of  $\{f_0, f_1, \dots, f_n\} \subset K[x_1, \dots, x_n]$  which contains  $n$  algebraically independent elements, where  $K$  is a field of characteristic zero. As an application of the product formula, we give a simple proof of Gabber's degree bound inequality for the inverse of a polynomial automorphism.

## 0. INTRODUCTION

Let  $K$  be a field, and let  $\{f_0, \dots, f_n\} \subset K[x_1, \dots, x_n]$  contain  $n$  algebraically independent polynomials over  $K$ . Then there is a unique irreducible polynomial (up to a constant factor in  $K^*$ )  $G(y_0, \dots, y_n) \in K[y_1, \dots, y_n]$  such that  $G(f_0, \dots, f_n) = 0$ . We call this  $G$  the minimal polynomial of  $f_0, \dots, f_n$  over  $K$ . It can be viewed as a natural generalization of the minimal polynomial of an algebraic element over a field  $K$ . Minimal polynomials are very useful for studying polynomial automorphisms, as well as birational maps. See, for instance, Yu [11, 12] and Li and Yu [3, 4]. In [3] and [12], two different effective algorithms for computing minimal polynomials are given, by means of Gröbner bases and Generalized Characteristic Polynomials (GCP), respectively.

The following theorem is well known.

**Theorem 0.1.** *Let  $\alpha$  be algebraic over a field  $K$  and  $m_\alpha(x)$  be the minimal polynomial of  $\alpha$  over  $K$ . Then*

$$m_\alpha(x) = \prod_{i=1}^d (x - \alpha^{(i)}),$$

where  $\alpha^{(1)}, \dots, \alpha^{(d)}$  are all roots of the polynomial  $m_\alpha(x)$  in the algebraic closure of  $K(\alpha)$  and  $\deg(m_\alpha(x)) = d$ , the number of roots of  $m_\alpha(x)$ .  $\square$

*Key words and phrases.* Minimal polynomials, Galois theory, product formula, polynomial automorphisms.

One can ask a natural question: Can Theorem 0.1 be generalized to higher-dimension cases?

The answer is affirmative. In this paper, by means of Galois theory, we give a product formula for the above minimal polynomial  $G$  of  $f_0, \dots, f_n$ .

## 1. STATEMENT OF THE MAIN THEOREM

**Theorem 1.1.** *Let  $K$  be a field of characteristic zero, and let*

$$\{f_0, f_1, \dots, f_n\} \subset K[x_1, \dots, x_n]$$

*with  $f_1, \dots, f_n$  algebraically independent over  $K$ . Let*

$$q := [K(x_1, \dots, x_n) : K(f_0, \dots, f_n)]$$

*and  $G(y_0, \dots, y_n)$  be the minimal polynomial of  $f_0, \dots, f_n$ . Then*

(i)

$$c[G(y_0, \dots, y_n)]^q = D \prod_{i=1}^d (y_0 - f_0(\alpha_1^{(i)}, \dots, \alpha_n^{(i)})),$$

*where  $c \in K^*$ ,  $(\alpha_1^{(i)}, \dots, \alpha_n^{(i)})$ ,  $i = 1, \dots, d$ , are all solutions of the system of equations  $f_i(x_1, \dots, x_n) = y_i$ ,  $i = 1, \dots, n$ , in the algebraic closure of the field  $K(y_1, \dots, y_n)$ ;  $y_1, \dots, y_n$  are algebraically independent transcendentals over  $K$ ; and  $D \in K[y_1, \dots, y_n]$  is the unique minimal denominator (up to a constant factor in  $K^*$ ) of the product  $\prod_{i=1}^d (y_0 - f_0(\alpha_1^{(i)}, \dots, \alpha_n^{(i)})) \in K(y_1, \dots, y_n)[y_0]$ .*

(ii) *The partial degrees of  $G$ ,  $\deg_{y_i}(G) = d_i/q$ , where  $d_i$  is the number of solutions of the system of equations  $f_j(x_1, \dots, x_n) = y_j$ ,  $j = 0, \dots, i-1, i+1, \dots, n$ , in the algebraic closure of  $K(y_1, \dots, y_n)$ . If  $d_i > 0$ , then*

$$d_i = [K(x_1, \dots, x_n) : K(f_0, \dots, f_{i-1}, f_{i+1}, \dots, f_n)].$$

(iii) *The total degree of  $G$ ,*

$$\deg(G) \leq \frac{1}{q} \max \left\{ \prod_{i \neq j} \deg(f_i) \right\}.$$

*Moreover, if for some  $k$ ,  $\deg(f_k) = \min_i \{\deg(f_i)\}$ , and  $f_0, \dots, f_{k-1}, f_{k+1}, \dots, f_n$  are algebraically independent over  $K$  and the system of equations  $f_i^+ = 0$ ,  $i = 0, \dots, k-1, k+1, \dots, n$ , has only the trivial solution, where  $f^+$  is the highest homogeneous form of  $f$ , then the equality holds.*

## 2. PROOF OF THE MAIN THEOREM

To prove Theorem 1.1, we need some lemmas.

**Lemma 2.1** (Mumford [6]). *Let  $K$  be a field of characteristic zero and let  $f_1, \dots, f_n \in K[x_1, \dots, x_n]$  be algebraically independent over  $K$ . Then  $\frac{K(x_1, \dots, x_n)}{K(f_1, \dots, f_n)}$  is a finite algebraic field extension. Let  $d := [K(x_1, \dots, x_n) : K(f_1, \dots, f_n)]$ . Then the system of equations*

$$\begin{cases} f_1(x_1, \dots, x_n) = y_1 \\ \vdots \\ f_n(x_1, \dots, x_n) = y_n \end{cases}$$

has precisely  $d$  distinct solutions in the algebraic closure of the field  $K(y_1, \dots, y_n)$ , where  $y_1, \dots, y_n$  are algebraically independent transcendentals over  $K$ . Moreover, if the system of equations

$$\begin{cases} f_1^+(x_1, \dots, x_n) = 0 \\ \vdots \\ f_n^+(x_1, \dots, x_n) = 0 \end{cases}$$

has only trivial solutions in the algebraic closure of  $K$ , then  $d = \prod_{i=1}^n \deg(f_i)$ .  $\square$

The next lemma is the key lemma in this paper. It has its own interests.

**Lemma 2.2.** Let  $K$  be a field of characteristic zero and let  $f_1, \dots, f_n \in K[x_1, \dots, x_n]$  be algebraically independent over  $K$ . Let  $(\alpha_1^{(i)}, \dots, \alpha_n^{(i)})$ ,  $i = 1, \dots, d$ , be all solutions of the system of equations

$$\begin{cases} f_1(x_1, \dots, x_n) = y_1 \\ \vdots \\ f_n(x_1, \dots, x_n) = y_n \end{cases}$$

in the algebraic closure of  $K(y_1, \dots, y_n)$ , and let

$$E := K(\alpha_1^{(1)}, \dots, \alpha_n^{(1)}, \dots, \alpha_1^{(d)}, \dots, \alpha_n^{(d)}).$$

Then  $\frac{E}{K(y_1, \dots, y_n)}$  is a Galois extension and the Galois group

$$G := \text{Gal} \left( \frac{E}{K(y_1, \dots, y_n)} \right)$$

acts transitively on the set  $\{(\alpha_1^{(i)}, \dots, \alpha_n^{(i)}) \mid i = 1, \dots, d\}$ .

*Proof.* First observe that

$$\frac{K(\alpha_1^{(i)}, \dots, \alpha_n^{(i)})}{K(y_1, \dots, y_n)} \cong \frac{K(x_1, \dots, x_n)}{K(f_1, \dots, f_n)}, \quad i = 1, \dots, d.$$

Hence

$$\frac{K(\alpha_1^{(i)}, \dots, \alpha_n^{(i)})}{K(y_1, \dots, y_n)} \cong \frac{K(\alpha_1^{(1)}, \dots, \alpha_n^{(1)})}{K(y_1, \dots, y_n)}, \quad i = 1, \dots, d.$$

Define

$$\sigma_i: K(\alpha_1^{(1)}, \dots, \alpha_n^{(1)}) \rightarrow K(\alpha_1^{(i)}, \dots, \alpha_n^{(i)})$$

as follows:  $\sigma_i(\alpha_k^{(1)}) = \alpha_k^{(i)}$ ,  $k = 1, \dots, d$ , and  $\sigma_i|_K$  is the identity map of  $K$ . Then linearly extend  $\sigma$  to  $K(\alpha_1^{(1)}, \dots, \alpha_n^{(1)})$ . Obviously  $\sigma_i(y_k) = y_i$ ,  $k = 1, \dots, n$ . Hence  $\sigma_i$  is a  $K(y_1, \dots, y_n)$ -isomorphism. Since

$$[K(\alpha_1^{(1)}, \dots, \alpha_n^{(1)}) : K(y_1, \dots, y_n)] = [K(x_1, \dots, x_n) : K(f_1, \dots, f_n)] = d,$$

there are precise  $d$   $K(y_1, \dots, y_n)$ -isomorphisms in a fixed algebraic closure of

$$K(\alpha_1^{(1)}, \dots, \alpha_n^{(1)}).$$

Hence  $\sigma_i$ ,  $i = 1, \dots, d$ , are all such  $dK(y_1, \dots, y_n)$ -isomorphisms. Now let  $\theta_1$  be a primitive element of  $K(\alpha_1^{(1)}, \dots, \alpha_n^{(1)})$  over  $K(y_1, \dots, y_n)$ ; then

$$K(\alpha_1^{(1)}, \dots, \alpha_n^{(1)}) = K(y_1, \dots, y_n)(\theta_1).$$

Therefore,

$$\alpha_k^{(1)} = g_k(\theta_1), \quad k = 1, \dots, n; \quad g_k(x) \in K(y_1, \dots, y_n)(x).$$

Let  $\theta_i := \sigma_i(\theta_1)$ . Then

$$\alpha_k^{(i)} = \sigma_i(\alpha_k^{(1)}) = \sigma_i(g_k(\theta_1)) = g_k(\sigma_i(\theta_1)) = g_k(\theta_i),$$

$$k = 1, \dots, n; \quad i = 1, \dots, d.$$

Hence  $\theta_i$  is a primitive element of  $K(\alpha_1^{(i)}, \dots, \alpha_n^{(i)})$  over  $K(y_1, \dots, y_n)$ . Let  $m(x)$  be the minimal polynomial of  $\theta_1$  over  $K(y_1, \dots, y_n)$ . Then  $m(\theta_i) = m(\sigma_i(\theta_1)) = \sigma_i(m(\theta_1)) = 0$ . In other words,  $\theta_i$ ,  $i = 1, \dots, d$ , are all conjugates of  $\theta_1$  over  $K(y_1, \dots, y_n)$ . Thus  $m(x) = \prod_{i=1}^d (x - \theta_i)$ . Hence  $E = K(\theta_1, \dots, \theta_d)$  is the splitting field of  $m(x)$  over  $K(y_1, \dots, y_n)$ . By Galois theory,  $\frac{E}{K(y_1, \dots, y_n)}$  is a Galois extension and the Galois group  $G$  acts transitively on  $\{\theta_1, \dots, \theta_d\}$ , hence acts transitively on  $\{\alpha_1^{(i)}, \dots, \alpha_n^{(i)} \mid i = 1, \dots, d\}$ .  $\square$

*Proof of Theorem 1.1.* We use the same notation as in Lemma 2.2 and its proof.

(i)  $\forall \sigma \in G$ ,

$$\begin{aligned} \sigma \left( \prod_{i=1}^d (y_0 - f_0(\alpha_1^{(i)}, \dots, \alpha_n^{(i)})) \right) &= \prod_{i=1}^d (y_0 - f_0(\sigma(\alpha_1^{(i)}), \dots, \sigma(\alpha_n^{(i)}))) \\ &= \prod_{i=1}^d (y_0 - f_0(\alpha_1^{(i)}, \dots, \alpha_n^{(i)})), \end{aligned}$$

by the transitivity of  $G$ . Hence

$$\prod_{i=1}^d (y_0 - f_0(\alpha_1^{(i)}, \dots, \alpha_n^{(i)})) \in K[y_0](y_1, \dots, y_n).$$

Denote by  $D$  its minimal denominator in  $K[y_1, \dots, y_n]$ . Let

$$h(y_0, \dots, y_n) \in K(y_1, \dots, y_n)[y_0]$$

be the unique minimal polynomial of  $f_0(\alpha_1^{(1)}, \dots, \alpha_n^{(1)})$  over  $K(y_1, \dots, y_n)$  such that  $h$  is an irreducible polynomial in  $K[y_0, \dots, y_n]$  (up to a constant factor in  $K^*$ ). Then

$$\begin{aligned} h(f_0(\sigma(\alpha_1^{(1)}), \dots, \sigma(\alpha_n^{(1)}))) &= h(\sigma(f_0(\alpha_1^{(1)}, \dots, \alpha_n^{(1)}))) \\ &= \sigma(h(f_0(\alpha_1^{(1)}, \dots, \alpha_n^{(1)}))) = 0, \quad \forall \sigma \in G. \end{aligned}$$

Hence

$$h(f_0(\alpha_1^{(i)}, \dots, \alpha_n^{(i)})) = 0, \quad i = 1, \dots, d.$$

This means that  $f_0(\alpha_1^{(i)}, \dots, \alpha_n^{(i)})$ ,  $i = 1, \dots, d$ , have the same minimal polynomial over  $K(y_1, \dots, y_n)$  which is an irreducible polynomial in  $K[y_0, \dots, y_n]$ , namely,  $h(y_0, \dots, y_n)$ . Now let  $G(y_0, \dots, y_n)$  be an irreducible factor of

$D \prod_{i=1}^d (y_0 - f_0(\alpha_1^{(i)}, \dots, \alpha_n^{(i)}))$  in  $K[y_0, \dots, y_n]$ . Then  $G$  is also irreducible in  $K(y_1, \dots, y_n)[y_0]$  by Gauss Lemma. Hence essentially  $G$  and  $h$  are the same (up to a constant factor in  $K^*$ ). Thus

$$c[G(y_0, \dots, y_n)]^q = D \prod_{i=1}^d (y_0 - f_0(\alpha_1^{(i)}, \dots, \alpha_n^{(i)})), \quad c \in K^*.$$

To show  $q = [K(x_1, \dots, x_n) : K(f_0, \dots, f_n)]$ , note that

$$\begin{aligned} & [K(x_1, \dots, x_n) : K(f_0, \dots, f_n)][K(f_0, \dots, f_n) : K(f_1, \dots, f_n)] \\ &= [K(x_1, \dots, x_n) : K(f_1, \dots, f_n)] = d. \end{aligned}$$

On the other hand, since the system of equations

$$\begin{aligned} f_0(t_1, \dots, t_n) &= f_0(x_1, \dots, x_n) \\ f_1(t_1, \dots, t_n) &= f_1(x_1, \dots, x_n) \\ &\vdots \\ f_n(t_1, \dots, t_n) &= f_n(x_1, \dots, x_n) \end{aligned}$$

has a solution  $t_i = x_i$ ,  $i = 1, \dots, n$ , it follows that

$$G(f_0(x_1, \dots, x_n), \dots, f_n(x_1, \dots, x_n)) = 0.$$

Therefore,  $G(y_0, \dots, y_n)$  is the minimal polynomial of  $f_0, \dots, f_n$ . Moreover,  $G(y_0, f_1, \dots, f_n)$  is the irreducible polynomial in  $K(f_1, \dots, f_n)[y_0]$ , since  $f_i$ ,  $i = 1, \dots, n$ , are transcendentals over  $K$ . Hence  $G(y_0, f_1, \dots, f_n)$  is the minimal polynomial of  $f_0$  over  $K(f_1, \dots, f_n)$ . Hence

$$\begin{aligned} q &= \frac{\deg_{y_0}(D \prod_{i=1}^d (y_0 - f_0(\alpha_1^{(i)}, \dots, \alpha_n^{(i)})))}{\deg_{y_0}(G(y_0, \dots, y_n))} \\ &= \frac{[K(x_1, \dots, x_n) : K(f_1, \dots, f_n)]}{[K(f_0, f_1, \dots, f_n) : K(f_1, \dots, f_n)]} \\ &= [K(x_1, \dots, x_n) : K(f_0, f_1, \dots, f_n)]. \end{aligned}$$

(ii) If  $d_i > 0$ , then

$$d_i = [K(x_1, \dots, x_n) : K(f_0, \dots, f_{i-1}, f_{i+1}, \dots, f_n)]$$

by Lemma 2.1. By (i),  $\deg_{y_i}(G) = \frac{d_i}{q}$ .

If  $d_i = 0$ , then  $f_0, \dots, f_{n-1}, f_{n+1}, \dots, f_n$  are algebraically dependent over  $K$  by Lemma 2.2. Hence  $y_i$  does not appear in the minimal polynomial  $G$  of  $f_0, \dots, f_n$ . Hence  $\deg_{y_i}(G) = 0 = \frac{d_i}{q}$ .

(iii) Without loss of generality, we can assume that  $\deg(f_0) = \min_i \{\deg(f_i)\}$ . Let

$$H(y_0, \dots, y_n) = G(y_0, y_0 - a_1 y_0, \dots, y_n - a_n y_0)$$

where we choose suitable  $a_1, \dots, a_n \in K$  so that one of the monomials of the highest total degree in  $H$  is  $a y_1^{\deg(H)}$ ,  $a \in K^*$ . Then  $H$  is the minimal polynomial of

$$f_0, f_1 + a_1 f_0, \dots, f_n + a_n f_0.$$

We obtain

$$\begin{aligned} \deg(G) &= \deg(H) = \deg_{y_0}(H) \\ &= \frac{[k(x_1, \dots, x_n) : k(f_1 + a_1 f_0, \dots, f_n + a_n f_0)]}{q} \quad \text{by (ii)} \\ &\leq \frac{1}{q} \prod_{i=1}^n \deg(f_i) \end{aligned}$$

by Lemma 2.1. Moreover, if the system of equations  $f_i^+ = 0$ ,  $i = 1, \dots, n$ , has only the trivial solution, then

$$\deg(G) \leq \deg_{y_0}(G) = \frac{1}{q} \prod_{i=1}^n (\deg(f_i))$$

by (ii) and Lemma 2.1. Hence the equality holds.  $\square$

*Remark 1.* Our main theorem can be generalized to minimal polynomials of rational functions over  $K$ .

### 3. AN APPLICATION

As an application of the main theorem, we give a very simple proof of the following known result.

**Theorem 3.1** (Gabber, see [2]). *Let  $K$  be a field and  $f = (f_1, \dots, f_n) : K^n \rightarrow K^n$  be a polynomial automorphism. Then*

$$\deg(f^{-1}) \leq (\deg(f))^{n-1},$$

where  $\deg(f) := \max_i \{\deg(f_i)\}$ .

*Remark 2.* Wang [10] first conjectured the above theorem holds. It is proved by Gabber (see [2]), who uses deep algebraic geometry. But here it is just an immediate consequence of Theorem 1.1(iii).

*Proof.* Write  $f = (f_1, \dots, f_n) \in (K[x_1, \dots, x_n])^n$  and  $f^{-1} = g = (g_1, \dots, g_n)$ . By Yu [11],  $g_i$  is the minimal polynomial of the  $i$ th face polynomials  $f_1(x_i = 0), \dots, f_n(x_i = 0)$  and obviously

$$K[x_1, \dots, x_n] = K[f_1(x_i = 0), \dots, f_n(x_i = 0)].$$

By Theorem 2.2(iii),

$$\deg(g_i) \leq \left( \max_k \{\deg(f_k(x_i = 0))\} \right)^{n-1} \leq (\deg(f))^{n-1}, \quad \forall i.$$

Hence  $\deg(g) = \max_i \{\deg(g_i)\} \leq (\deg(f))^{n-1}$ .  $\square$

*Remark 3.* For the special case  $n = 1$  in Theorem 1.1, Abhyankar [1] and McKay and Wang [5] have proved  $D \prod_{i=1}^d (y_0 - f_0(\alpha_1^{(i)}))$  is essentially the Sylvester resultant  $\text{Res}_{x_1}(y_0 - f_0(x_1), y_1 - f_1(x_1))$ . In a forthcoming paper [9], by means of the sparse elimination theory in Sturmfels [8] and Pederson and Sturmfels [7], we prove that for any  $n$ ,

$$D \prod_{i=1}^d (y_0 - f_0(\alpha_1^{(i)}, \dots, \alpha_n^{(i)}))$$

is essentially the 'sparse resultant' of  $y_0 - f_0, \dots, y_n - f_n$  with respect to  $y_1, \dots, y_n$ . Hence we can explicitly express the minimal polynomial of  $f_0, \dots, f_n$  in terms of all coefficients of  $f_0, \dots, f_n$ .
